

CONTROL SYSTEM INTEROPERABILITY AN EXTREME CASE:

Merging DOOCS and TINE

P. Duval, A. Aghababayan, O. Hensler, K.
Rehlich, DESY, Hamburg, Germany

Interoperability ?

- With **commercial packages** ...
- **Wrapping/Binding** non-native interfaces ?
 - e.g. How to interface **EPICS** with **LabView** ?
 - or **MatLab**, **Python**, **Perl**, **Root**, etc.
 - Just ask **COSYLAB** to do it ?
 - Use the **interoperability tools** that come with the package.
 - Java + JNI
 - .NET + System.Runtime.InteropServices
 - **MatLab** + MEX interface
 - **LabView** + external library support
 - etc.
- **Go native** ?
 - e.g. **STARS** has a native Perl interface.
 - Most have a native java interface.
 - Not always practical !

Interoperability ?

- With other **control system frameworks** ...
 - “We love our **EPICS** and they love their **TANGO** ...”
 - What to do?
- Gateways or translation layers that ‘*trade data*’.
 - epics2tango, tango2epics ...
- Assume as given:
 - control system frameworks manage interoperability to commercial software.
- Concentrate on:
 - interoperability **between** the **control system frameworks** !
- Why worry about this?

Motivation

- *Warring factions* within a single institute or project !
 - And those at the top who want results ...
 - (But this never happens, right?)
- Experiments, Test Equipment *from other institutes*
 - Sudden deadlines to get something new into the system ...
 - Recent example at DESY:
 - **OLYMPUS** experiment brought some detector software from **MIT** with **EPICS** interface.
 - *Immediate integration* with the rest of the control system via **epics2tine**.

Motivation

- Include *useful features* of another system
 - e.g. **STARS**
 - excellent system for beamline control
 - use **STARS-TINE** bridge for multicasting BEAM parameters to the 70 end stations at Photon Factory in **KEK**.
- *Major Release upgrades*
 - e.g. **TACO** and **TANGO**
- And if you're *not 100% EPICS*
 - you'll probably have to interoperate with it.

DOOCS / TINE

- Both are *mature* control systems
 - Primarily in use at DESY
 - But used at other institutes and *industry* as well
 - (*No, the entire rest of the control-system world does NOT use either EPICS or TANGO*).
- **TINE:**
 - An **ISOLDE** spin-off (CERN ~1991)
 - Transport is **socket based**
- **DOOCS:**
 - Early collaboration with **TACO** (~1995)
 - Transport is **SunRPC** based
- **ALL** accelerator control at DESY is either **TINE** or **DOOCS**.
 - Additional motivation to have seamless interoperation.
 - (*Yes, you will find EPICS in cryogenics and infrastructure and TANGO at the HASYLAB beamlines*).
- Strategies for *interoperability* ...

How best to 'trade data' ?

- System A (**oranges**) and System B (**apples**).
- Have to deal with **apples** and **oranges** one way or another!
 - Translate System **A** request into System **B** language:  → 
 - Translate System **B** response back to System **A** language:  → 
 - 1. **Apple** to **Orange** 'gateways'
 - lives as an external process
 - 2. **Apple** to **Orange** 'plugs'
 - live on 'Orange' clients
 - 3. **Apple** to **Orange** 'translators'
 - live on 'Apple' servers

Translation Layer

- **Method 1** (*gateway*)

- Requires setting up an extra process for each target server.
- Connectivity problems harder to trace ?
- Least invasive

- **Method 2** (client-side *plugs*)

- Popular: JCOP, cdev, abeans, CSS, jddd, ACOP, ...
- Available features depend on target server !
 - e.g. asking a server to multicast data would only work on a TINE server!

- **Method 3** (server-side *translator*)

- Most *invasive*
 - New software (new risks) on critical server components.
- Best method for merging **ALL** control system features.

Frameworks Models

- Brief Review:
- **1: Database Model**
 - **EPICS, VISTA** (i.e. VSystem not the OS)
 - 'get', 'set', 'monitor' elements in a database.
- **2: Device Server Model**
 - **TANGO, DOOCS, ACS, STARS, TINE**
 - Server offers methods to a collection of 'devices' at some location.
- **3: Property Server Model**
 - **STARS, TINE**
 - Server is a service with properties, which can have keywords.
- *How to map e.g. model 1 to model 2 and vice versa ?*

DOOCS/TINE Merger

- Uses **server-side translation** ! (*Method 3*) 
 - All **TINE** features available to a **DOOCS** server ! 
- **DOOCS** device servers maps *perfectly* into **TINE** device servers and vice versa! 
- **TINE** *property* servers present a **browsing issue** with some **DOOCS** utilities. 
 - *Straightforward* to deal with ! 

Server-side Translation

- **DOOCS** *DAQ protocol*
 - independent issue
 - does not impact the DOOCS/TINE merger
- **DOOCS** transport based on *SunRPC*
 - Synchronous polling and scalability problems ?
 - *Aside:*
 - **TACO** later (**post-DOOCS** collaboration) introduced inverted SunRPC client-servers to accommodate asynchronous transfer.
 - **TACO** + **SunRPC** gave way to **TANGO** + **CORBA**
 - **DOOCS**: Make use of **TINE** from the merger
- **TINE**:
 - Asynchronous transfer
 - QoS steering (UDP, TCP, Multicast)
 - **Contract coercion**

Contract Coercion

- “*Joe the Programmer*” is driving the data flow
 - The ability to do things efficiently (e.g. asynchronous updates on event) does **NOT** mean application programmers will do it this way!
 - *Synchronous calls are easy to understand and program !*
- Panel builders (**jddd**, **MEDM**, ...) designed to be simple.
 - *Optimized and efficient transport is **NOT** simple !*
 - How is “*Joe the Programmer*” using the panel builder?
- What does your **MatLab** interface look like?
 - **Note:** Yes, you can do callbacks in **MatLab** !
- **e.g.**
 - *Try synchronously polling all 300 BPMs individually at 10 Hz within some client application and then run the application on 10 different stations !*

A Server takes control of its Clients

TINE: Contract Coercion in the transport protocol

Example: doing 1 thing for 1 effective client instead of 600 things for 10

Client

- Give me property "Pressure" for pump "OL146.2"
- Ok then, monitor "Pressure" for pump "OL146.2"
- Ok then, monitor "Pressure" for all pumps
- Ok then, I'll listen for the multicast

Server

- No! You'll have to monitor this !
- No! You'll have to monitor the entire MCA (look for index 17)
- Ok, but I'm going to multicast it!

Let the Merger Begin ...

- **Step 1: request-response mapping**
 - **Data type mapping**
 - **primitives** exist in both frameworks
 - **compound data types** must ALL map !
 - e.g. NAME-FLOAT-INT32 as an atomic data type
 - **TINE** offers user-defined data types (**structures**)
 - DOOCS doesn't
 - DOOCS -> TINE not a problem
 - TINE -> DOOCS ?
 - structure fields are accessible !
 - **Dispatch mapping**
 - client is calling property P, is sending type T1, wants type T2, access = A
 - *can now use TINE scheduling in DOOCS !*
 - **Error/Status code mapping**
 - Status = 0 is always 'success'
 - But: can send data with status (e.g. here's the data, but it's not calibrated)

DOOCS/TINE Merger

- **Step 2: *transport mapping***
 - **client Side API**
 - should support **asynchronous communication**
 - can disguise asynchronous listeners with a **synchronous façade**.
 - asynchronous API should be **rich** enough to support **ALL** features
 - e.g. How to launch an asynchronous data link but WAIT for the initial callback ?
- ***Is that it? Are we done?***
 - With a gateway you might even be done at Step 1!

DOOCS/TINE Merger

- We're **done** when a random **TINE** or **DOOCS** server passes the **Duck Test** using a random **TINE** or **DOOCS** control system utility.

“If it looks like a duck, swims like a duck, and quacks like a duck, then it probably is a duck”

- i.e. A kind of '*Turing Test*'.

DOOCS/TINE Merger

- **Step 3: *central Service and Utilities***

- **Naming**

- **Archiving**

- **Alarm**

- **Security**

- **Remote Management**

- **etc.**

DOOCS/TINE Merger

• DOOCS Naming

- /facility/server/location/property
- Equipment Name Server (ENS) provides facility and server(s)
- **No** separate **subsystem** identification.
 - Subsystem is usually applied to the facility.
 - Server “Modulator” in “FLASH.RF” instead of “FLASH”
- **Strict** OO Device Server model
 - locations have properties
- **Meta Properties not** principally distinguished from Properties
 - “P” is on the same footing as “P.EGU” or “P.HIST”

• TINE Naming

- /context/server/device/property
- Equipment Name Server (ENS) provides context and server(s)
- Separate **subsystem** identification! (not part of name space)
- OO Device Server model
 - devices have properties
- Or Property Server model
 - properties have keywords
- **Meta Properties are** distinguished from Properties
 - “P” is NOT on the same footing as “P.EGU” or “P.HIST”

DOOCS/TINE Naming

DOOCS
'RPCtest' Utility:

TINE
'Instant Client' :

Analogous to
TANGO + jive
EPICS + ?

The image shows two overlapping software windows. The background window is titled "DOOCS Communication and Plot Utility (Vers. API 5.10.23, DDD 2.2.73) duval@McsMcMini1". It features three columns for "Facility", "Device", and "Location". The "Facility" column lists TTF2.VAC, TTF2.RF, TTF2.DIAG, TTF2.DAQ, and TTF2.EXP. The "Device" column lists AMSCOPE, KLY.ADC, KLY.INTERLOCK, KLY.PLC, and Mod39.PulseData. The "Location" column lists VMEKLY2._SVR, VMEKLY2.SHM, KLY2, ACC1, and KLY2.1. A "Property Description" table is visible on the right, listing properties like NAME, STS.ERROR, STS.NEWERROR, STS.ERRORMASK, STS.ONLINE, SET.ONLINE, ERROR, and ERROR.STR. The foreground window is titled "Java Instant Client" and shows configuration options for "Device Context" (PETRA), "Device Subsystem" (DIAG), "Device Server" (BPM), and "Device Name" (BPM_SWR_13). It also displays a plot of "SA X position" data with a y-axis from -2e6 to 3e6 and an x-axis with labels BPM_SWR_13, BPM_NOR_52, and BPM_SL_68. The plot shows a noisy signal fluctuating around zero. The "Java Instant Client" window includes a menu bar, a toolbar with "Read" and "Poll" buttons, and a "Draw Mode" section with options like "SimpleHistogram", "Autoscale", "Log Scale", "History", "Suggest Decorations", "Suggest Draw Mode", and "Input Pane".

DOOCS/TINE Archiving

• DOOCS

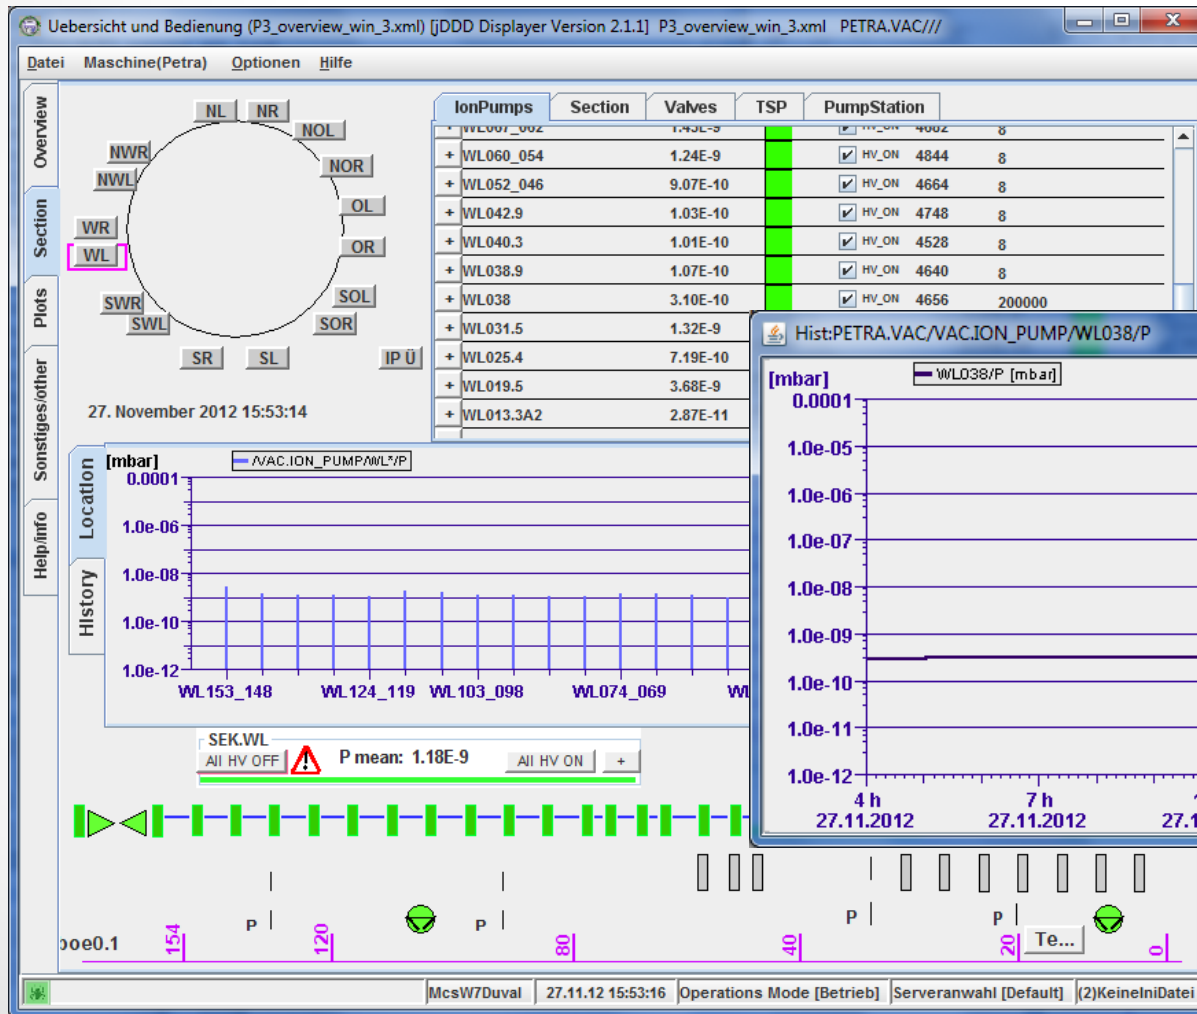

- Independent **DAQ** system
 - can also tag 'events'.
- Local archiving of specific (configured) properties
- Record = single channel
- Accessible via "<P>.HIST" meta-property
- No sampling raster
- **Thumbnails** available
 - fast access of general information over long time intervals

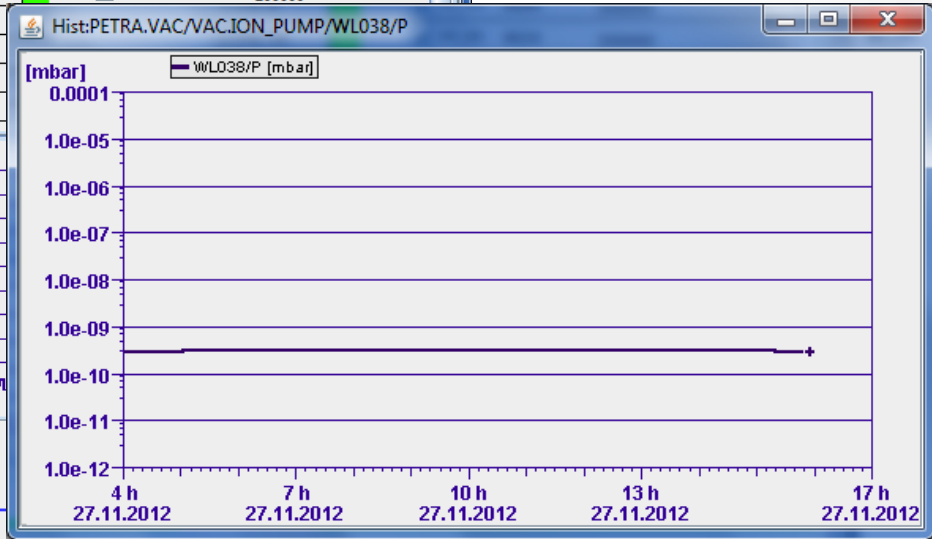

• TINE

- Central **Event Archive**
- Local archiving of specific (configured) properties
- Record = single channel or **multi-channel arrays** !
- Accessible via "<P>.HIST" meta-property
- Sampling raster configurable
- Automatic raster for optical zooming
 - "**points of interest**" insert peaks and valleys.
- **Central archiving** of specific properties
 - Many possible filters

DOOCS/TINE Archiving

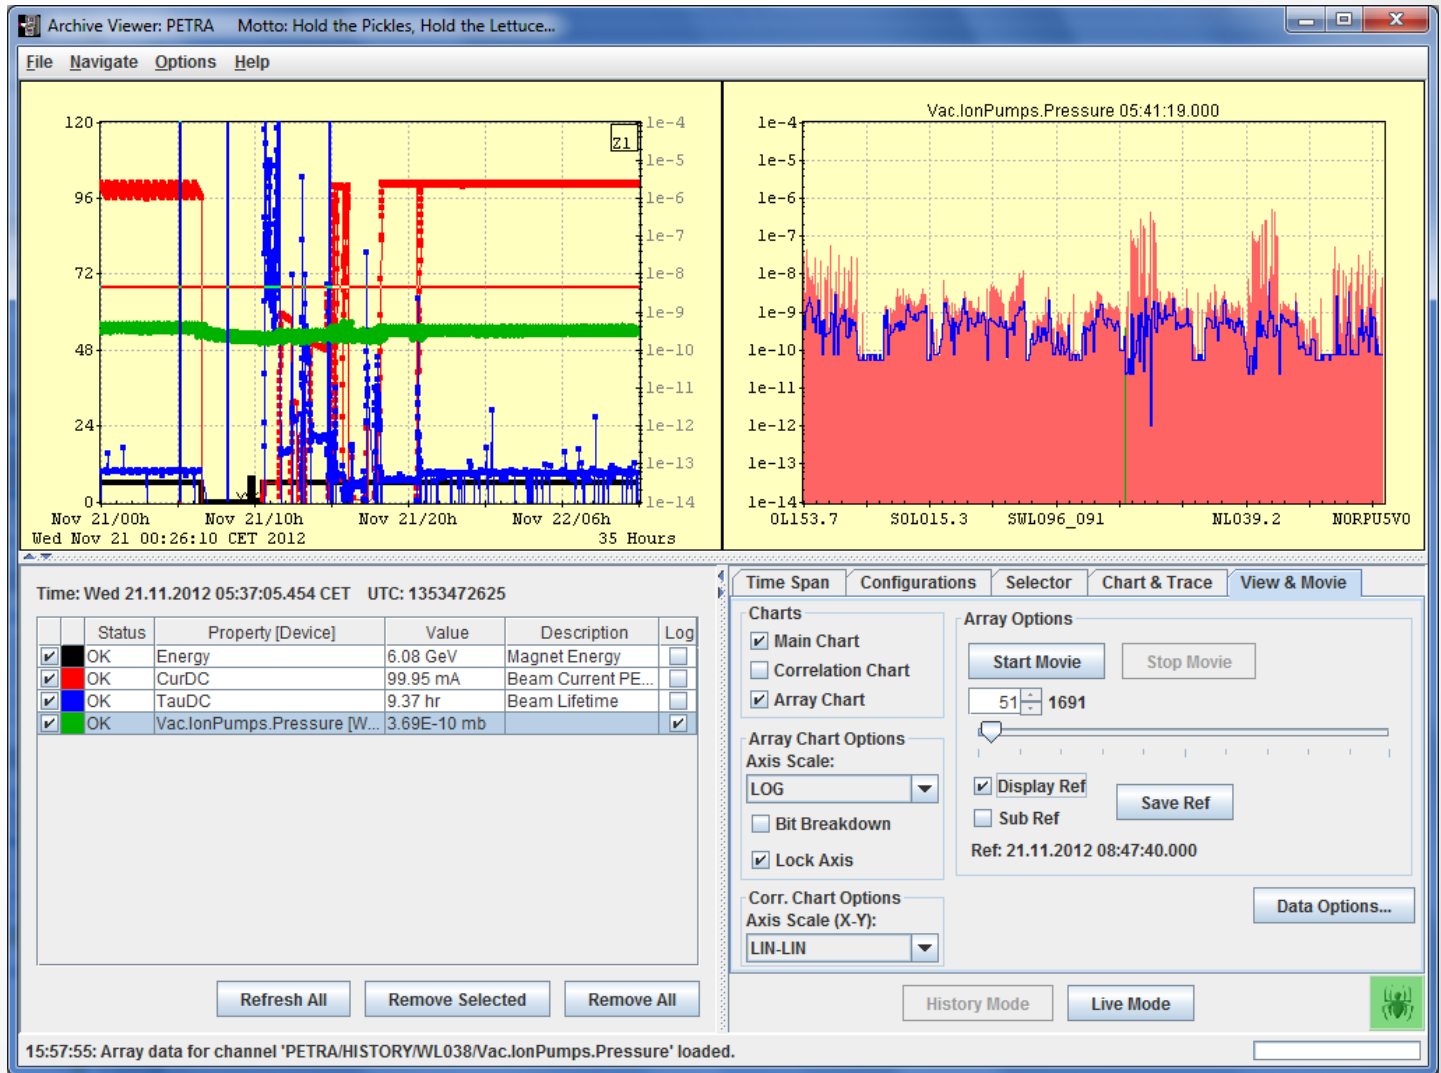

DOOCS local histories example :

DOOCS/TINE Archiving

TINE
Archive Viewer

Optical or
Digital
Zooming,
Trends and
Snapshots,
Movies,
Correlations,
FFT, Fits, etc.

DOOCS/TINE Archiving

The screenshot displays the DOOCS/TINE Archiving software interface. The main window, titled "Uebersicht und Bedienung (REGAE_vac_main_05.xml)", shows a schematic diagram of the REGAE VAKUUM system. A red arrow points from a data point on the plot in the "Archive Viewer" window to a corresponding component in the schematic.

Archive Viewer: REGAE (Motto: Hold the Pickles, Hold the Lettuce...)

between the two:
No mean feat!

DOOCS/TINE Alarms

• DOOCS Alarms

- Devices have alarms
- **5** severity levels
- **Push** system
- Alarms have an status/error **string**
- Also set TINE Alarm on the server side
 - error string -> alarm data

• TINE Alarms

- Devices have alarms
- **15** severity levels
 - 4 principal categories
- **Pull** system
- Alarms have **data** (up to 64 bytes)
- Also push DOOCS Alarm at the Central Alarm Server.

DOOCS/TINE Security

• DOOCS Security

- Open READ
- WRITE (set) calls must pass security !
- Server Level or Property Level
- UNIX style
 - **gid, uid** of the caller determines access rights
- Non-UNIX systems
 - Locate caller 'user name' in a **nis (ldap)** database to ascertain gid, uid.

• TINE Security

- Open READ (default)
 - Can configure '**exclusive READ**'
- WRITE (set) calls must pass security !
- Server level, property level or device level.
- Compare **user name** and **address** of caller to the configured ACL tables.
- Can acquire an **Access Lock**

DOOCS/TINE

Remote Management

- **DOOCS**

- Process watchdog
 - Unix-like or windows
- Special DOOCS server
- Monitors process statistics
- (re)starts missing server processes
- Allows remote stop and start

- **TINE**

- Process watchdog
 - Different solutions for
 - Unix-like
 - Windows
 - VxWorks
 - DOS
- Monitors process statistics
- (re)starts missing server processes.
- Allows remote stop and start.

Culture Shock

• DOOCS

- Generally use **jddd panels**
 - Simple clients with display widgets
- MatLab, etc.
- **No** explicit multi-channel support
 - But heavy reliance on wildcards and filters.
- **No** user-defined structures (hard to attach to a widget)
- Names tend to be
 - ALL **uppercase** with underscores
 - e.g. "PROPERTY_ONE"

• TINE

- Generally use **rich clients** (java, .NET)
 - RAD tools (**ACOP beans**)
- MatLab, etc.
- **Explicit** multi-channel support
 - Can also use wildcards and filters
- User-defined structures are popular with some developers !
- Names tend to be
 - **camel case**
 - e.g. "PropertyOne"

jddd Applications

The screenshot displays the jddd (jddd Display) application interface, which is used for monitoring and controlling the PETRA-VAC system. The main window, titled "Uebersicht und Bedienung (P3_overview_win_3.xml) [jDDD Displayer Version 2.1.1] P3_overview_win_3.xml PETRA.VAC///", shows a circular overview of the accelerator sections. The sections are labeled with codes such as SEKNL, SEKNR, SEKNOL, SEKNORP, SEKNORPU, SEKNORPUA, SEKNORPUB, SEKNORPUBA, SEKNORPUBB, SEKNORPUBC, SEKNORPUBD, SEKNORPUBE, SEKNORPUBF, SEKNORPUBG, SEKNORPUBZW, SEKNORPUBZX, SEKNORPUBZY, SEKNORPUBZZ

The interface includes several key components:

- Beam Parameters:** A table showing the current beam status:

DC-Current	100.36
Bunche	320
Energy	6.08
Lifetime	8.38
Mean pressure	1.34E-8
- Pressure Plot:** A graph titled "Max and Mean Pressure" showing pressure in mbar over time. The y-axis ranges from $1.0e-10$ to $1.0e-06$ mbar. The x-axis shows time points at 13 h (29.11.2012), 22 h (29.11.2012), and 7 h (30.11.2012).
- Control Panels:** Two smaller windows are overlaid. The top one, titled "sv_op_win.xml", shows a control panel for "ORT: NR60" with a "Freigabe" (release) status and buttons for "auf" (open) and "zu" (close). The bottom one, titled "abschnitt_op_win.xml", shows a control panel for "SEK.NORPU5_6" with a "Status" table and a "Plot" showing pressure over time. The status table includes "MICRO" and "INTERLOCK" sections.

The bottom status bar indicates the current system state: "McsW7Duval 30.11.12 13:53:24 Operations Mode [Betrieb] Serveranwahl [Default] (2)KeinIniDatei".

DOOCS/TINE Merger

- **In the field:**
 - **FLASH**
 - DOOCS culture with notable TINE servers (e.g. magnets)
 - **PETRA**
 - TINE culture with notable DOOCS servers (e.g. vacuum)
 - **REGAE**
 - Many native DOOCS and TINE servers all speaking TINE
 - Many **jddd** panels and **acopbeans** rich clients.
 - Many **MatLab** applications
 - Generally smooth operations for the past half-year.
 - **XFEL**
 - To be: DOOCS centric with DOOCS and TINE servers all speaking TINE
 - Currently gaining experience via **REGAE**
 - Similar mix of **jddd**, rich clients, **MatLab** as in **REGAE** (?)
 - Heavy use of **DOOCS DAQ**
 - We'll see how it goes ...

DOOCS/TINE Merger

- **Status**

- **response-request translation** ~98 % complete 
- **services mapping** : ~80 % complete 
- **culture shock:**
 - Although most all '**features**' are mapped, those in one 'world' often remain **unknown** and unused the other 'world'. 
 - Can sometimes battle different '**mindsets**' with **contract coercion**. 
 - can trap synchronous polling of individual channels, etc.
 - There are still sometimes '**gateways**' that are created for no other purpose than to bridge cultural differences. 
- Components still carry a '**brand name**' (and probably always will) 
- *Strive for a non-zero sum game (WIN-WIN!)*
